01. OUR STAR, THE SUN

The Heart of the System

The Sun is a nearly perfect sphere of hot plasma, with internal convective motion that generates a magnetic field via a dynamo process. It is by far the most important source of energy for life on Earth.

Mercury: The smallest and fastest planet, it zips around the Sun in just 88 Earth days.

Mars: The Red Planet, a cold desert world that may have once hosted liquid water and life.

Kings of the System

■ Hydrogen (89%)

Ice Giants & Beyond

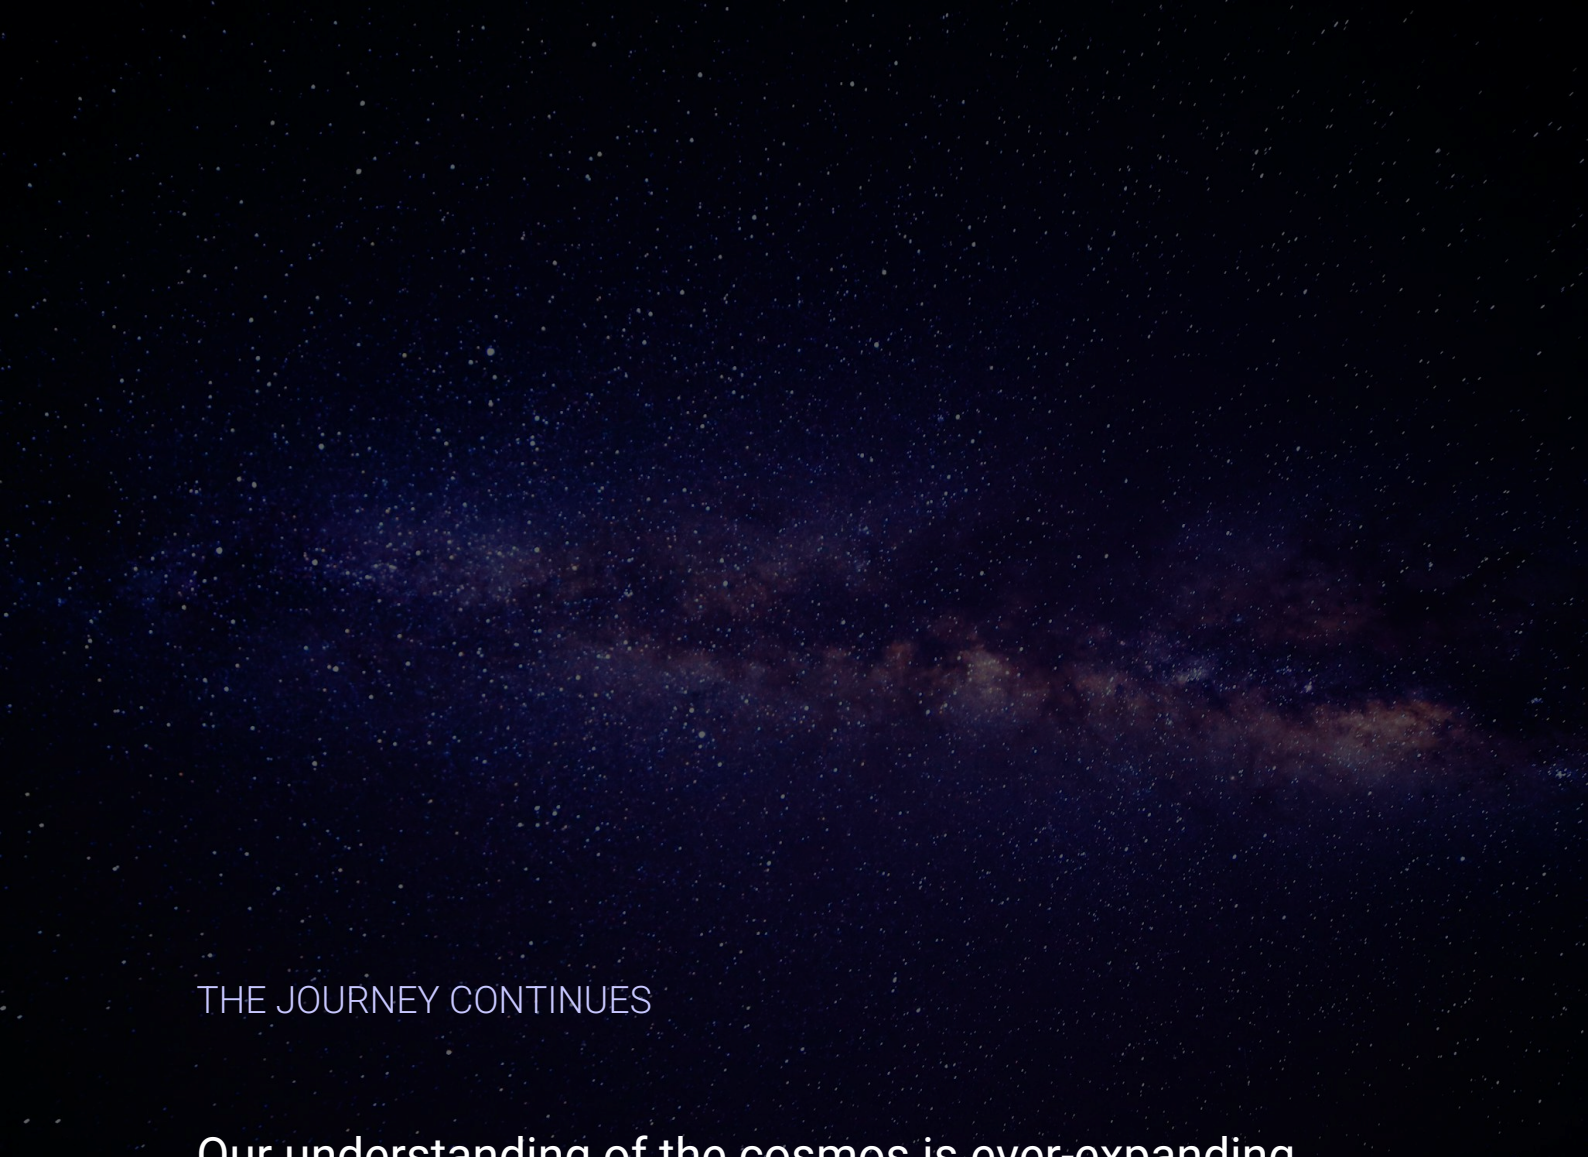

Uranus and Neptune are the ice giants, with atmospheres containing higher amounts of 'ices' like water, ammonia, and methane.

Beyond them lies the Kuiper Belt, a vast, icy debris field, home to dwarf planets like Pluto, the frontier of our solar system.

Exploration Progress of Kuiper Belt

THE JOURNEY CONTINUES

Our understanding of the cosmos is ever-expanding.
The worlds of our solar system are just the first chapter
in an infinite story written in the stars.
